Chapter 4 · Original slide 34

Transformations of Functions

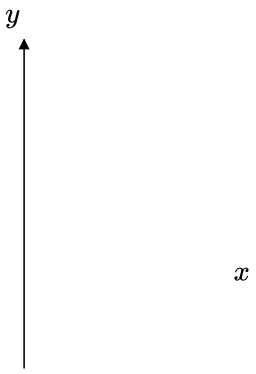

34

Suppose $f(x) = x^2$

Sketch $y = f(x)$:

Sketch $y = f(x + 2)$

What do you notice about the relationship between the graphs of $y = f(x)$ and $y = f(x + 2)$?

Chapter 4 · Original slide 35

Transformations of Functions

35

This is all you need to remember when considering how transforming your function transforms your graph...

	Affects which axis?	What we expect or opposite?
Change **inside** $f()$		
Change **outside** $f()$		

Therefore...

$y = f(x - 3)$

$y = f(x) + 4$

$y = f(5x)$

$y = 2f(x)$

Chapter 4 · Original slide 36

Sketching transformed graphs

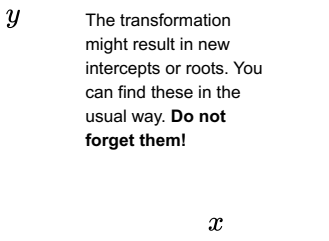

36

Sketch $y = x^2 + 3$

Imagine a sketch of $y = x^2$ and then do the translation, ensuring you adjust any intercepts with the axes.

Sketch $y = \frac{2}{x+1}$

The transformation might result in new intercepts or roots. You can find these in the usual way. **Do not forget them!**

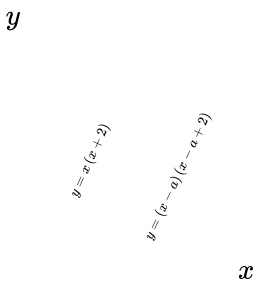

Draw asymptotes using a dotted line and write its equation on it.

Chapter 4 · Original slide 37

More Examples

37

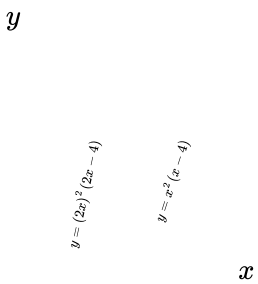

Sketch $y = x(x+2)$. On the same axes, sketch $y = (x-a)(x-a+2)$, where $a > 2$.

Note that our intercepts are in terms of a.

Sketch $y = x^2(x-4)$. On the same axes, sketch the graph with equation

$$y = (2x)^2(2x-4)$$

Chapter 4 · Original slide 38

Reflections of Graphs

38

If $y = x(x+2)$, sketch $y = f(x)$ and $y = -f(x)$ on the same axes.

You did this at GCSE. The minus is outside the function, so affects the output, i.e. the y value. The y values are negated, resulting in a reflection in the x-axis.

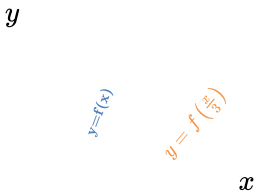

Chapter 4 · Original slide 39

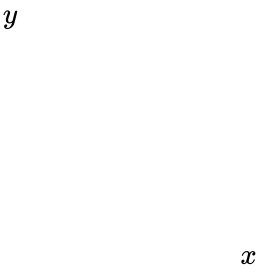

Test Your Understanding

39

If $y = (x+1)(x-2)$, sketch $y = f(x)$ and $y = f(\frac{x}{3})$ on the same axes.

Sketch the graph of $y = \frac{2}{x} + 1$, ensuring you indicate any intercepts with the axes.

40

7 The point $P(4, -1)$ lies on the curve with equation $y = \mathrm{f}(x)$.
a State the coordinates that point P is transformed to on the curve with equation $y = \mathrm{f}(x - 2)$.
b State the coordinates that point P is transformed to on the curve with equation $y = \mathrm{f}(x) + 3$.

8 The graph of $y = \mathrm{f}(x)$ where $\mathrm{f}(x) = \frac{1}{x}$ is translated so that the asymptotes are at $x = 4$ and $y = 0$. Write down the equation for the transformed function in the form $y = \frac{1}{x+a}$.

Exercise 4F – Pure 1 Page 78 (stretches/reflections)

44

9 a Sketch the graph of $y = (x-2)(x-3)^2$. **b** The graph of $y = (ax-2)(ax-3)^2$ passes through the point $(1, 0)$. Find two possible values for a.

Chapter 4 · Original slide 45

Effect of transformation on specific points

45

Sometimes you will not be given the original function, but will be given a sketch with specific points and features you need to transform.
Where would each of these points end up?

$\mathbf{y=f(x)}$	$(\mathbf{4,3})$	$(\mathbf{1,0})$	$(\mathbf{6,-4})$
$y=f(x+1)$			
$y=f(2x)$			
$y=3f(x)$			
$y=f(x)-1$			
$y=f\left(\frac{x}{4}\right)$			
$y=f(-x)$			
$y=-f(x)$

Edexcel C1 May 2012
Q10

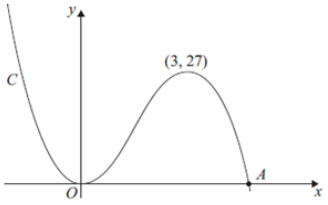

Figure 1

Figure 1 shows a sketch of the curve C with equation $y = f(x)$, where $f(x) = x^2(9 - 2x)$. There is a minimum at the origin, a maximum at the point $(3, 27)$ and C cuts the x-axis at the point A.

(a) Write down the coordinates of the point A. (1)

(b) On separate diagrams sketch the curve with equation

(i) $y = f(x + 3)$,

(ii) $y = 2f(x)$.

On each sketch you should indicate clearly the coordinates of the maximum point and any points where the curves cross or meet the coordinate axes. (5)

The curve with equation $y = f(x) + k$, where k is a constant, has a maximum point at $(3, 10)$.

(c) Write down the value of k. (1)

(a)

(b)(i)

(ii)

(c)

Exercise 4G Pure Y1 Pages 80

47

5 The point $P(2, 1)$ lies on the graph with equation $y = f(x)$.

a On the graph of $y = f(ax)$, the point P is mapped to the point $Q(4, 1)$. Determine the value of a.

b Write down the coordinates of the point to which P maps under each transformation

i $f(x - 4)$ **ii** $3f(x)$ **iii** $\frac{1}{2}f(x) - 4$
